

Writing a lab report or academic article with tau L^AT_EX class

Author One^{a,1}, Author Two^{b,2} and Author Three^{b,c,3}

^aAffiliation of author one

^bAffiliation of author two

^cAffiliation of author three

Professor/Authority or other information

Abstract—Welcome to tau (τ) L^AT_EX class designed especially for your lab reports or academic articles. In this example template, we will guide you through the process of using and customizing this class to your needs. For more information of this class check out the appendix section. There, you will find codes that define key aspects of the template, allowing you to explore and modify them.

Keywords—L^AT_EX class, lab report, academic article, tau class

1. Introduction

Welcome to *tau class* for preparing your lab reports or academic articles. Throughout this guide, we will show you how to use this template and how to make modifications to this class.

This class includes the following files placed in the ‘tau-class’ folder: tau.cls, tauenvs.sty, taubabel.sty and README.md. Also, a main.tex, tau.bib and some examples.

2. Title

The `\maketitle` command generates the title and author information section, including the professor name and affiliations. The title can be modified in tau-class/tau.cls/title style section.

By default, *tau class* shows the title on the left. However, you can change `\raggedright` to `\centering` in `\titlepos` to move the title to the center or, modify it to your own preferences.

In addition to the `\title` command, a new command named `\journalname` has been added to include more information.

If you do not need this command, you can undefine it and the content will be adjusted automatically.

3. Abstract

The abstract and keywords are defined using the `\keywords` and `\begin{abstract}\end{abstract}` commands respectively. For the abstract to appear, make sure the `\tauabstract` command is always included after the beginning of the document.

If the keywords are not declared in the preamble, the content will be adjusted automatically.

4. Document style options

4.1. Tau start

We included the `\taustart{}` command, which provides a personalized letrine for the beginning of a paragraph.

4.2. Line numbering

By implementing the *lineno* package, the line numbering of the document can be placed with the command `\linenumbers`.

I recommend placing the command after the abstract and table of contents for a better appearance (comment or delete if not required).

4.3. Table of contents

The *tau class* provides a customized design for the table of contents. Each level of the ToC provides a preview of the content and its location in the document.

5. Figures and tables

5.1. Figures

Fig. 1 shows an example figure.

Figure 1. Example figure obtained from PGFPlots [1].

Fig. 2 shows an example of two figures that covers the width of the page. It can be placed at the top or bottom of the page. The space

(a) Example left figure.

(b) Example right figure.

Figure 2. Example figure that covers the width of the page obtained from PGFPlots [1].

44 between the figures can also be changed using the `\hspace{Xpt}`
45 command.

46 5.2. Tables

47 Table 1 shows an example table. The `\tabletext{}` is used to add
48 notes to tables easily.

Table 1. Small example table.

Column 1	Column 2
Data 1	Data 2
Data 3	Data 4

Note: I'm a table text for additional information.

49 6. Tau packages

50 6.1. Tauenvs

51 This template has its own environment package *tauenvs.sty* designed
52 to enhance the presentation of the document. Among these custom
53 environments are *tauenv*, *info* and *note*.

54 There are two environments which have a predefined title. These
55 can be included by the command `\begin{note}` and `\begin{info}`.
56 All the environments have the same style.

57 An example using the tau environment is shown below.

Environment with custom title

This is an example of the custom title environment. To add a
title type `[frametitle=Your title]` next to the beginning of
the environment (as shown in this example).

58 Tauenv is the only environment that you can customize its title. On
59 the other hand, *info* and *note* adapt their title to Spanish automatically
60 when this language package is defined.

61 6.2. Taubabel

62 In this new version, we have included a package called *taubabel*,
63 which have all the commands that automatically translate from Eng-
64 lish to Spanish when this language package is defined.

65 By default, tau displays its content in English. However, at the
66 beginning of the document you will find a recommendation when
67 writing in Spanish.

68 *Note:* You may modify this package if you want to use other lan-
69 guage than English or Spanish. This will make easier to translate the
70 document without having to modify the class document.

7. Equation

Equation 1, shows the Schrödinger equation as an example.

$$\frac{\hbar^2}{2m} \nabla^2 \Psi + V(\mathbf{r})\Psi = -i\hbar \frac{\partial \Psi}{\partial t} \quad (1)$$

The *amssymb* package was not necessary to include, because stix2
font incorporates mathematical symbols for writing quality equations.
In case you choose another font, uncomment this package in tau-
class/tau.cls/math packages.

If you want to change the values that adjust the spacing above and
below the equations, play with `\setlength{\eqskip}{8pt}` value
until the preferred spacing is set.

8. Adding codes

This class¹ includes the *listings* package, which offers customized
features for adding codes in L^AT_EX documents specifically for C, C++,
L^AT_EX and Matlab.

You can customize the format in tau-class/tau.cls/listings style.

```

1 function fibonacci_sequence(num_terms)
2     % Initialize the first two terms of the
   sequence
3     fib_sequence = [0, 1];
4
5     if num_terms < 1
6         disp('Number of terms should be greater
   than or equal to 1.');
```

Code 1. Example of Matlab code.

¹Hello there! I am a footnote :)

If line numbering is defined at the beginning of the document, I recommend placing the command `\nolinenumbers` at the start and `\linenumbers` at the end of the code.

This will temporarily remove line numbering and the code will look better as shown in Code 1.

9. References

The default formatting for references follows the IEEE style. You can modify the style of your references, for that, go to `tau-class/tau.cls/biblatex`. See appendix for more information.

10. Appendix

10.1. Alternative title

You can make the following modification in `tau-class/tau.cls/title` preferences section to change the position of the title.

```
1 \newcommand{\titlepos}{\centering}
```

Code 2. Alternative title.

This will move the title to the center.

10.2. Info environment

An example of the `info` environment declared in the ‘`tauenvs.sty`’ package is shown below. Remember that *info* and *note* are the only packages that translate their title (English or Spanish).

Information

Small example of `info` environment.

10.3. Equation skip value

With the `\eqskip` command you can change the spacing for equations. The default *eqskip* value is 8pt.

```
1 \newlength{\eqskip}\setlength{\eqskip}{8pt}
2 \expandafter\def\expandafter\normalsize\
3   expandafter{%
4     \normalsize%
5     \setlength\abovedisplayskip{\eqskip}%
6     \setlength\belowdisplayskip{\eqskip}%
7     \setlength\abovedisplayshortskip{\eqskip-\
8     baselineskip}%
9     \setlength\belowdisplayshortskip{\eqskip}%
10  }
```

Code 3. Equation skip code.

10.4. References

In case you require another reference style, you can go to `tau-class/tau.cls/biblatex` and modify the following.

```
1 \RequirePackage[
2   backend=biber,
3   style=ieee,
4   sorting=ynt
5 ]{biblatex}
```

Code 4. References style.

By default, *tau class* has its own `.bib` for this example, if you want to name your own bib file, change the *addbibresource*.

```
1 \addbibresource{tau.bib}
```
